The following list give an overview of the folder structure of this python repository:

name of repository: vhh_sbd

- $\hbox{\bf \cdot ApiSphinxDocumentation/: includes all files to generate the documentation as well as the created documentations} \\ \hbox{\bf (html, pdf)}$
- config/: this folder includes the required configuration file
- sbd/: this folder represents the shot-type-classification module and builds the main part of this repository
- **Demo/**: this folder includes a demo script to demonstrate how the package have to be used in customized applications
- Develop/: includes scripts to evaluate the implemented approach as well as several helper scripts used during development stage. Furthermore, a script is included to create the package documentation (pdf, html).
- **README.md**: this file gives a brief description of this repository (e.g. link to this documentation)
- requirements.txt: this file holds all python lib dependencies and is needed to install the package in your own virtual environment
- setup.py: this script is needed to install the sbd package in your own virtual environment

CONTENTS 1

CHAPTER

ONE

SETUP INSTRUCTIONS

This package includes a setup.py script and a requirements.txt file which are needed to install this package for custom applications. The following instructions have to be done to used this library in your own application:

Requirements:

- Ubuntu 18.04 LTS
- CUDA 10.1 + cuDNN
- python version 3.6.x

Create a virtual environment:

- create a folder to a specified path (e.g. /xxx/vhh_sbd/)
- python3 -m venv /xxx/vhh_sbd/

Activate the environment:

• source /xxx/vhh_sbd/bin/activate

Checkout vhh_sbd repository to a specified folder:

• git clone https://github.com/dahe-cvl/vhh_sbd

Install the sbd package and all dependencies:

- change to the root directory of the repository (includes setup.py)
- python setup.py install

Note: You can check the success of the installation by using the commend *pip list*. This command should give you a list with all installed python packages and it should include *vhh_sbd*

Note: Currently there is an issue in the *setup.py* script. Therefore the pytorch libraries have to be installed manually by running the following command: *pip install torch=1.5.0+cu101 torchvision==0.6.0+cu101 -f https://download.pytorch.org/whl/torch_stable.html*

PARAMETER DESCRIPTION

DEBUG_FLAG This parameter is used to activate or deactivate the debug mode.

RESIZE_DIM This flag is used to to specify the resize dimension. (only usable if DOWNSCALE_FLAG is active).

CONVERT2GRAY This flag is used to convert a input frame into a grayscale frame (0... deactivate, 1... activate).

CROP This flag is used to center crop a input frame (0... deactivate, 1... activate).

DOWNSCALE This flag is used to scale a input frame into the specified dimension (0... deactivate, 1... activate).

HISTOGRAM_EQU This parameter is used to to specify a valid pre-processing method (clahe" or "classic" or "none).

CANDIDATE_SELECTION This flag is used to to enable or disable the candidate selection mode.

SAVE_RAW_RESULTS This parameter is used to save raw results (e.g. debug visualizations).

PATH_RAW_RESULTS This parameter is used to specify the path for saving the raw results.

PREFIX_RAW_RESULTS This parameter is used to specify the prefix for the results file.

POSTFIX_RAW_RESULTS This parameter is used to specify the postfix for the results file.

SAVE FINAL RESULTS This parameter is used to save final results (e.g. csv list).

PATH_FINAL_RESULTS This parameter is used to specify the path for saving the final results.

PREFIX_FINAL_RESULTS This parameter is used to specify the prefix for the results file.

POSTFIX_FINAL_RESULTS This parameter is used to specify the postfix for the results file.

PATH VIDEOS This parameter is used to specify the path to the videos.

THRESHOLD_MODE This parameter is used to specify the threshold mode (adaptive OR fixed).

THRESHOLD This parameter is used to specify the threshold (only in fixed threshold mode - [0-1]).

ALPHA This parameter is used to specify the adaptive threshold.

WINDOW_SIZE This parameter is used to specify the window size (frames history window - only for adaptive mode).

BACKBONE_CNN This parameter is used to specify the backbone cnn model (vgg16 OR squeezenet).

SIMILARITY_METRIC This parameter is used to specify the similarity metric (cosine OR euclidean).

PATH_PRETRAINED_MODEL This parameter is used to specify the path to the pre-trained model.

SAVE_EVAL_RESULTS This parameter is used to save evaluation results (e.g. visualizations, ...).

PATH_RAW_RESULTS This parameter is used the raw results path.

PATH_EVAL_RESULTS This parameter is used to specify the path to store the evaluation results path.

PATH GT ANNOTATIONS This parameter is used to groundtruth annotations used for evaluation.

CHAPTER

THREE

API DESCRIPTION

This section gives an overview of all classes and modules in sbd as well as an code description.

3.1 Configuration class

class sbd.Configuration.**Configuration**(config_file: str)

Bases: object

This class is needed to read the configuration parameters specified in the configuration.yaml file. The instance of the class is holding all parameters during runtime.

Note: e.g. ./config/config_vhh_test.yaml

the yaml file is separated in multiple sections config['Development'] config['PreProcessing'] config['SbdCore'] config['Evaluation']

whereas each section should hold related and meaningful parameters.

loadConfig()

Method to load configurables from the specified configuration file

3.2 CandidateSelection class

This class is used for sbd candidate selection. It detects frames ranges of about 16 frames which includes an abrupt cut. The loaded model is pre-trained on the deepsbd dataset.

run (video_path)

This method is used to run the candidate selection process.

Parameters video_path – This parameter must hold a valid path to a video file.

Returns This method returns a numpy array with a list of all detected frames ranges.

3.3 Evaluation class

```
class sbd.Evaluation.Evaluation(config_file: str)
    Bases: object
```

This class is used to evaluate the implemented algorithm.

calculateEvaluationMetrics()

This method is used to calculate the evaluation metrics.

Returns This methods returns a numpy array including a list of the calculated metrics (precision, recall, . . .).

```
calculateMetrics (tp_cnt, fp_cnt, tn_cnt, fn_cnt)
```

This method is used to calculate the evaluation metrics precision, recall and f1score.

Parameters

- tp_cnt This parameter must hold a valid integer representing the tp counter.
- fp_cnt This parameter must hold a valid integer representing the fp counter.
- tn_cnt This parameter must hold a valid integer representing the tn counter.
- fn_cnt This parameter must hold a valid integer representing the fn counter.

Returns This method returns the scores for precision, recall, accuracy, fl_score, tp_rate and fp rate.

```
calculateSimilarityMetric (results_np: numpy.ndarray, threshold=4.5)
```

This method is used to calculate the similarity metrics based on the pre-calculated raw results.

Parameters

- results_np This parameter must hold a valid numpy array.
- threshold This parameter holds a threshold. (default: 4.5)

Returns This method returns a numpy array including the final shot boundaries.

```
evaluation (result_np, vid_name)
```

This method is needed to evaluate the gathered results for a specified video.

Parameters

- result_np This parameter must hold a valid numpy array.
- **vid_name** This parameter represents a video name.

Returns This method returns the calculated TP. TN. FP and FN counters.

export2CSV (data_np: numpy.ndarray, header: str, filename: str, path: str)

This method is used to export the gathered results to a csv file.

Parameters

- data_np This parameter holds a valid numpy array.
- header This parameter holds a csv header line (first line in the file semicolon seperated).
- **filename** This parameter must hold a valid file name.
- path THis parameter must hold a valid file path.

exportMovieResultsToCSV (fName, res_np)

This method is used to export video results to csv file.

3.3. Evaluation class 5

Parameters

- filepath This parameter must hold a valid file_path.
- res_np This parameter must hold a valid numpy array containing the final results.

loadRawResultsFromCsv (filepath)

This method is used to load raw results from csv file.

Parameters filepath – This parameter must hold a valid file_path.

Returns This method returns a numpy array containing the raw_results.

loadRawResultsFromNumpy (filepath)

This method is used to load raw results from numpy array.

Parameters filepath – This parameter must hold a valid file_path.

Returns This method returns a numpy array containing the raw_results.

loadResultsFromCSV (filepath)

This method is used to load final results from csv file.

Parameters filepath – This parameter must hold a valid file_path.

Returns This method returns a numpy array containing the final results.

plotPRCurve (results_np)

This method is needed to create and plot the precision_recall curve.

Parameters results_np - This parameter must hold a vaild numpy array including the precision and recall scores.

plotROCCurve (results_np)

This method is needed to create and plot the roc curve.

Parameters results_np - This parameter must hold a vaild numpy array including the precision and recall scores.

run()

This method is needed to run the evaluation process.

3.4 PreProcessing class

```
class sbd.PreProcessing.PreProcessing(config_instance: sbd.Configuration.Configuration)
Bases: object
```

This class is used to pre-process frames.

```
{\tt applyTransformOnImg} (\textit{image: numpy.ndarray}) \rightarrow {\tt numpy.ndarray}) \rightarrow {\tt numpy.ndarray}
```

This method is used to apply the configured pre-processing methods on a numpy frame.

Parameters image – This parameter must hold a valid numpy image (WxHxC).

Returns This methods returns the preprocessed numpy image.

```
applyTransformOnImgSeq(img\_seq: numpy.ndarray) \rightarrow numpy.ndarray
```

```
claHE (img: numpy.ndarray)
```

This method is used to calculate the Contrast Limited Adaptive Histogram Equalization.

Parameters img – This parameter must hold a valid numpy image.

Returns This method returns the pre-processed image.

```
classicHE (img: numpy.ndarray)
```

This method is used to calculate the classic histogram equalization.

Parameters img – This parameter must hold a valid numpy image.

Returns This method returns the pre-processed image.

convertRGB2Gray (img: numpy.ndarray)

This method is used to convert a RBG numpy image to a grayscale image.

Parameters img – This parameter must hold a valid numpy image.

Returns This method returns a grayscale image (WxHx1).

```
crop (img: numpy.ndarray, dim: tuple)
```

This method is used to crop a specified region of interest from a given image.

Parameters

- img This parameter must hold a valid numpy image.
- dim This parameter must hold a valid tuple including the crop dimensions.

Returns This method returns the cropped image.

```
resize (img: numpy.ndarray, dim: tuple)
```

This method is used to resize a image.

Parameters

- img This parameter must hold a valid numpy image.
- dim This parameter must hold a valid tuple including the resize dimensions.

Returns This method returns the resized image.

3.5 SBD class

```
class sbd.SBD.SBD (config_file: str)
    Bases: object
```

Main class of shot boundary detection (sbd) package.

```
calculateDistance(x, y)
```

This method is used to calculate the distance between 2 feature vectors.

Parameters

- **x** This parameter represents a feature vector (one-dimensional)
- y This parameter represents a feature vector (one-dimensional)

Returns This method returns the similarity score of a specified distance metric.

convertShotBoundaries2Shots (shot_boundaries_np: numpy.ndarray)

This method converts a list with detected shot boundaries to the final shots.

Parameters shot_boundaries_np - This parameter must hold a numpy array with all detected shot boundaries.

Returns This method returns a numpy list with the final shots.

3.5. SBD class

exportFinalResultsToCsv(shot l: list, name: str)

This method is used to export the final results to a csv file (semicolon seperated). :param shot_l: This parameter must hold a valid array list including the final results list. :param name: This parameter represents the name of the csv list.

exportRawResultsAsCsv_New (results_np: numpy.ndarray)

This method is used to export the raw results to a csv file.

Parameters results_np - This parameter must hold a valid numpy list including the raw results.

exportRawResultsAsNumpy (results_np: numpy.ndarray)

This method is used to export the raw results to a numpy file.

Parameters results_np - This parameter must hold a valid numpy list including the raw results.

runOnFolder()

This method is used to run sbd on all video files included in a specified folder.

Returns This method returns a numpy list of all detected shots in all videos.

runOnSingleVideo (video_filename, max_recall_id=- 1)

Method to run sbd on specified video.

Parameters

- video_filename This parameter must hold a valid video file path.
- max_recall_id [required] integer value holding unique video id from VHH MMSI system

runWithCandidateSelection (candidates_np)

This method is used to run sbd with candidate selection mode.

Parameters candidates_np – THis parameter must hold a valid numpy list including all pre-selected candidates.

Returns This method returns a numpy list with all detected shots in a video.

runWithoutCandidateSelection (src_path, vid_name)

This method is used to run sbd without candidate selection mode.

Parameters

- **src_path** THis parameter must hold a valid path to the video file.
- vid_name This parameter must hold a valid videofile name.

Returns This method returns a numpy list with all detected shots in a video.

3.6 Shot class

```
class sbd.Shot.Shot (sid, movie_name, start_pos, end_pos)
    Bases: object
```

This class represents on shot and contains shot properties such as start/end frame index of a shot, shot-id and video name.

convert2String()

This method is used to convert all properties of a shot into a semicolon-separated string. :return:

3.6. Shot class

```
printShotInfo()
```

This method is used to print all properties of a shot.

3.7 Video class

```
class sbd.Video.Video
```

Bases: object

This class represents on video and contains properties such as dimensions, length, format, video name

```
getFrame (frame\_id: int) \rightarrow numpy.ndarray
```

This method is used to return one frame specified with a given frame index.

Parameters frame_id - This parameter must hold a valid integer frame index.

Returns This method returns a numpy frame with a specified index (position).

load (vidFile: str)

This method is used to load a video of a specified storage.

Parameters vidFile – This parameter must hold a valid video file path.

```
printVIDInfo()
```

This method is used to print all video properties.

3.8 Utils module

```
class sbd.utils.STDOUT TYPE
```

Bases: object

This class represents message types.

ERROR = 2

INFO = 1

sbd.utils.getCommandLineParams()

This function is used to read commandline parameters (e.g. just used in development stage) :return: list of parameters.

```
sbd.utils.printCustom(msg: str, type: int)
```

This function represents a customized print function (error/info msg). :param msg: Message to print. :param type: Type of message (info or error).

3.7. Video class 9
